Homework 1

蒋翌坤 20307100013

Problem 1

We have $f_{X_{(1)},X_{(n)}}(x,y) = n(n-1)[F(y) - F(x)]^{n-2}f(x)f(y)$ Let $u = y - x, v = \frac{1}{2}(x+y)$, then |J| = 1

$$f_{R,V}(u,v) = n(n-1)[F(v+\frac{u}{2}) - F(v-\frac{u}{2})]^{n-2}f(v-\frac{u}{2})f(v+\frac{u}{2})$$

Here, $F(x) = \frac{x}{a}$, $f(x) = \frac{1}{a}$ for 0 < x < a. Therefore, the joint pdf of R and V are

$$f_{R,V}(u,v) = \begin{cases} n(n-1) \left[\frac{v + \frac{u}{2}}{a} - \frac{v - \frac{u}{2}}{a} \right]^{n-2} \frac{1}{a} \frac{1}{a} = \frac{n(n-1)}{a^n} u^{n-2}, 0 < u < a, 0 < v < a < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0, 0 < 0,$$

Problem 2

Draw two samples from N(0, a) as X, Y, order them, we get $X_{(1)}, X_{(2)}$. Therefore, $Z = X_{(1)}$. So, the distribution of Z is the same as $X_{(1)}$:

$$f_Z(z) = 2[1 - F(z)]^{2-1} f(z) = 2f(z)[1 - F(z)]$$

where $F, f \sim N(0, a)$

Problem 3

 $Y = d \tan X$, where $X \sim U(0, \pi/2)$, d is a constant. Therefore, the pdf of Y is

$$f_Y(y) = \frac{2}{\pi} \cdot \frac{1}{1 + \frac{y^2}{d^2}} \cdot \frac{1}{d} = \frac{2}{\pi d(1 + \frac{y^2}{d^2})} = \frac{2}{\pi d(1 + \frac{y^2}{d^2})}, 0 < y < \infty$$

$$E(Y) = \int_0^\infty y \cdot \frac{2}{\pi d(1 + \frac{y^2}{d^2})} dy = \frac{2}{\pi} \int_0^\infty \frac{\frac{y}{d}}{1 + \frac{y^2}{d^2}} dy$$

$$\stackrel{u=y/d}{=} \frac{2d}{\pi} \int_0^\infty \frac{u}{1 + u^2} du = \frac{2d}{\pi} \cdot \frac{1}{2} \log(1 + u^2) \Big|_0^\infty = \infty$$

Problem 4

 \mathbf{a}

Let $W_1=X_1^2/\sigma^2\sim\chi_1^2,W_2=X_2^2/\sigma^2\sim\chi_1^2$, we have $Y_1=\sigma^2(W_1+W_2),Y_2^2=\frac{W_1}{W_1+W_2}$ $W_1=Y_1Y_2^2/\sigma^2,W_2=Y_1(1-Y_2^2)/\sigma^2,$

$$|J| = \begin{vmatrix} \frac{Y_2^2}{\sigma^2} & \frac{2Y_1Y_2}{\sigma^2} \\ \frac{1-Y_2^2}{\sigma^2} & -\frac{2Y_1Y_2}{\sigma^2} \end{vmatrix} = \frac{2Y_1|Y_2|}{\sigma^4}$$

The joint distribution of W_1, W_2 is

$$f_{W_1,W_2}(w_1,w_2) = \frac{1}{2} \cdot \frac{1}{\sqrt{w_1 w_2}} \cdot \frac{1}{\Gamma(1/2)^2} \exp(-\frac{w_1 + w_2}{2})$$

Then, the joint distribution of Y_1, Y_2 is

$$f_{Y_1,Y_2}(y_1, y_2) = \frac{1}{2} \cdot \frac{\sigma^2}{|y_1 y_2| \sqrt{1 - y_2^2}} \cdot \frac{1}{\Gamma(1/2)^2} \exp(-\frac{y_1}{2\sigma^2}) \cdot \frac{2y_1 |y_2|}{\sigma^4}$$
$$= \frac{1}{\sigma^2} \exp(-\frac{y_1}{2\sigma^2}) \cdot \frac{1}{\Gamma(1/2)^2} \cdot \frac{1}{\sqrt{1 - y_2^2}}$$

b

$$\frac{Y_1}{\sigma^2} = X_1^2/\sigma^2 + X_2^2/\sigma^2 \sim \chi_2^2, \text{ so}$$

$$f_{Y_1}(y_1) = \frac{1}{\sigma^2} \exp(-\frac{y_1}{2\sigma^2}), y_1 > 0$$

$$f_{Y_2}(y_2) = \int_0^\infty f_{Y_1, Y_2}(y_1, y_2) dy_1 = \frac{1}{\Gamma(1/2)^2} \cdot \frac{1}{\sqrt{1 - y_2^2}} \int_0^\infty \frac{1}{\sigma^2} \exp(-\frac{y_1}{2\sigma^2}) dy_1$$

$$= \frac{1}{\Gamma(1/2)^2} \cdot \frac{1}{\sqrt{1 - y_2^2}}$$

$$f_{Y_1, Y_2}(y_1, y_2) = f_{Y_1}(y_1) f_{Y_2}(y_2)$$

Therefore, Y_1, Y_2 are independent.

A geometric interpretation is that consider a right triangle whose two sides are X_1 and X_2 $(X_1, X_2 > 0)$, then Y_1 is the square of the hypotenuse, and Y_2 is the sine of the angle opposite to X_1 . Since Y_1 and Y_2 are independent, we know that the length of the hypotenuse and the angle are independent.

Problem 5

Let
$$\delta = \sqrt{\sum_{i=1}^{n} a_i^2}$$
, $\mathbf{C} = \begin{pmatrix} \frac{a_1}{\delta} & \cdots & \frac{a_n}{\delta} \\ c_{21} & \cdots & c_{2n} \\ \vdots & \ddots & \vdots \\ c_{n1} & \cdots & c_{nn} \end{pmatrix}$, and \mathbf{C} orthogonal. Let $\mathbf{W} = \mathbf{C}\mathbf{X}$. We have
$$\mathbf{W}^T \mathbf{W} = \mathbf{X}^T \mathbf{C}^T \mathbf{C} \mathbf{X} = \mathbf{X}^T \mathbf{X}$$
$$W_1 = \frac{a_1}{\delta} X_1 + \cdots + \frac{a_n}{\delta} X_n = \frac{1}{\delta} \sum_{i=1}^n a_i X_i$$
$$\mathbf{E}(W_1) = \frac{1}{\delta} \sum_{i=1}^n a_i \mathbf{E}(X_i) = \frac{1}{\sqrt{\sum_{i=1}^n a_i^2}} \sum_{i=1}^n a_i^2 = \sqrt{\sum_{i=1}^n a_i^2}$$
$$\mathbf{Var}(W_1) = \frac{1}{\delta^2} \sum_{i=1}^n a_i^2 \mathbf{Var}(X_i) = \frac{1}{\sum_{i=1}^n a_i^2} \sum_{i=1}^n a_i^2 = 1$$

Therefore, $W_1 \sim N(\sqrt{\sum_{i=1}^n a_i^2}, 1)$

When $i \geq 2$,

$$E(W_i) = E(\sum_{k=1}^{n} c_{ik} X_k) = \sum_{k=1}^{n} c_{ik} a_k = \delta \sum_{k=1}^{n} c_{ik} \frac{a_k}{\delta} = 0$$
$$Var(W_i) = \sum_{k=1}^{n} c_{ik}^2 = 1$$

Therefore, $W_i \sim N(0,1), W_2^2 + \dots + W_n^2 \sim \chi_{n-1}^2$.

Let
$$Y = W_1 \sim N(\sqrt{\sum_{i=1}^n a_i^2}, 1), Z = W_2^2 + \dots + W_n^2 \sim \chi_{n-1}^2$$
, we have

$$X_1^2 + \dots + X_n^2 = W_1^2 + W_2^2 + \dots + W_n^2 = Y^2 + Z$$

Y depends on W_1 and Z depends on W_2, \ldots, W_n , and W_1, W_2, \ldots, W_n are independent. Therefore, Y and Z are independent.
